O que é SciVerse ScienceDirect?

- SciVerse ScienceDirect contém um pouco mais de 25% de toda a informação em texto completo nas áreas de ciência, tecnologia e medicina publicada mundialmente.
- SciVerse ScienceDirect oferece uma rica coleção de mais de 2.500 títulos de revistas, sendo aproximadamente 2.300 disponíveis em texto completo para o Portal Periódicos Capes.

O que é SciVerse ScienceDirect?

- São revistas publicadas pela Elsevier e sociedades parceiras, como American Psychological Association (APA) e Anderson Publishing Ltd.

O que é SciVerse ScienceDirect?

- Usada por mais de 11 milhões de pessoas
- Mais de 6.000 instituições no mundo possuem acesso
- Atualizada diariamente

Revistas no SciVerse ScienceDirect

- Cobre mais de 2.500 revistas
- Base multidisciplinar
- Mais de 10 milhões de artigos em texto completo
 - Programa de retrospectivos, retrocedendo até o Volume 1 - Fascículo 1 (Backfiles)
 - Acesso eletrônico a artigos aprovados à espera de ser publicado na versão impressa (Articles in Press)

Revistas no SciVerse ScienceDirect

- Coleções hoje disponíveis para a Capes:
 - Freedom Collection
 - Cell Press (pesquisa top em Ciências da Vida)
 - The Clinics of North America (área de saúde)
 - Masson Collection (45 títulos de revistas de medicina em Francês)
 - Doyma Collection (50 títulos de revistas de medicina em Espanhol)

Livros no SciVerse ScienceDirect

- Livros Eletrônicos disponíveis para a Capes
 - Coleções:
 - Agricultural and biological sciences
 - Biochemistry, genetics and molecular biology
 - Publicados de 1995 a 2008
- Obras de Referência
 - International Encyclopedia of the Social & Behavioral Sciences
 - Encyclopedia of Social Measurement

Utilização

- Interface fácil e intuitiva
 - Fácil navegação pelo títulos disponíveis
 - Vários recursos de busca pelo conteúdo
- Refinamento da busca na página de resultados
- Impressão de qualquer artigo no formato PDF
- Exibição do texto completo em formato HTML – com links que facilitam a navegação e permitem acesso a mais conteúdo
- Download das citações bibliográficas para programas de gerenciamento de referências
- Arquivos multimídia incluídos nos artigos (vídeos, áudio, planilhas de cálculo, arquivos complementares)
- Busca por imagens

Recursos avançados

- Home page personalizável pelo usuário
- Armazenamento de suas preferências pessoais para uso futuro
- Links rápidos (Quick Links)
- Visualização das ações mais recentes
- Criação de uma lista pessoal de títulos favoritos
- Salvar e re-executar estratégias de busca
- Programação de alertas (busca, novos volumes/números, por tema e Artigos Top 25)
- RSS Feeds
- Histórico de busca para armazenar temporariamente suas estratégias de buscas
- Envio por e-mail do link de um artigo em texto completo

Obrigado!

Abstract

There is likely to be heterogeneity in the processes putting children at risk of injury. This paper examines whether errors may form a dissociable process from risk-taking. We further examine whether these constructs mediate the links between emotional and behavioural problems and unintentional injury. We designed the parent-report Children's Injury Related Behaviour (CIRB) questionnaire to measure errors and risk-taking in everyday activities. The sample consisted of 499 children aged 4–11 years recruited from the community. Principal components analysis showed that a two factor solution was appropriate and provided scales to measure risk and error with good psychometric properties. Both risk and error scales were independently related to injury history. Errors were associated with conduct problems, emotional problems and hyperactivity. Risk-taking was associated with conduct problems and hyperactivity only. Risk-taking and errors accounted for the links of conduct problems and hyperactivity with injury involvement. The distinction between risk and error has implications for research and interventions to reduce childhood injuries.

Abstract

This paper provides guidance on how to assess the safety of foods derived from genetically modified crops (GM crops); it summarises conclusions and recommendations of Working Group 1 of the ENTRANSFOOD project. The paper provides an approach for adapting the test strategy to the characteristics of the modified crop and the introduced trait, and assessing potential unintended effects from the genetic modification. The proposed approach to safety assessment starts with the comparison of the new GM crop with a traditional counterpart that is generally accepted as safe based on a history of human food use (the concept of substantial

equivalent). This case-focused approach ensures that foods derived from GM crops that have passed this extensive test-regime are as safe and nutritious as currently consumed plant-derived foods. The approach is suitable for current and future GM crops with more complex modifications. First, the paper reviews test methods developed for the risk assessment of chemicals, including food additives and pesticides, discussing which of these methods are suitable for the assessment of recombinant proteins and whole foods. Second, the paper presents a systematic approach to combine test methods for the safety assessment of foods derived from a specific GM crop. Third, the paper provides an overview on developments in this area that may prove of use in the safety assessment of GM crops, and recommendations for research priorities. It is concluded that the combination of existing test methods provides a sound test-regime to assess the safety of GM crops. Advances in our understanding of molecular biology, biochemistry, and nutrition may in future allow further improvement of test methods that will over time render the safety assessment of foods even more effective and informative.

1. Introduction

Approaches to the regulation and safety assessment of genetically modified (GM) crops have been developed in a very proactive manner. The first international and national provisions for the safety assessment and regulation of genetically modified organisms (GMOs), including GM crops and derived foods were drawn up by scientific experts in the mid-1980s (OECD, 1986; US OSTP, 1986). This was nearly a decade before the first regulatory approval of a genetically modified crop in 1995. Since then, the global area of commercial cultivation of such crops has risen to 58.7 million hectares in 2002 (James, 2002). Commercially cultivated GM crops include soybean, maize, cotton, canola, potatoes, and tomatoes. At present, the most widely grown GM crops contain new genes that confer herbicide tolerance or insect resistance. Other crops are being developed that have improved nutritional characteristics for their food or feed use; GM soybeans and oil seed rape with altered fatty acid profiles, for example, have already undergone regulatory review. Future advances in genomic sciences promise the discovery of new genes conferring desirable characteristics to crops that may fundamentally alter a crop's metabolic functions, promising further nutritional enhancement and resistance to abiotic stresses. It is important that we should continue to proactively assess whether current approaches to safety assessment are appropriate also for future GM crop products with more complex traits.

This paper presents a systematic approach for combining different test methods to assess the safety of foods derived from a specific GM crop. It provides guidance on how to tailor the test strategy to the characteristics of the modified crop and the introduced trait and identifying potential unintended effects from the genetic modification. The approach builds on internationally agreed guidelines and principles, and is suitable for current and future GM crops with more

complex modifications. The remainder of this paper is divided into four sections. Section 2 provides an overview of regulations and internationally agreed principles and guidelines for risk assessment of chemicals and foods derived from GM crops. Section 3 reviews existing test methods developed for chemicals and food additives, and examines their suitability for testing the safety of foods and food constituents derived from GM crops. Section 4 systematically sets out how to determine whether the GM crop is 'as safe as' a suitable comparator with a history of human consumption. It provides guidance on how to compile information on the parent crop and on the genetic modification. This information in turn guides the choice of test parameters and methods in the analysis of any introduced substance and of the whole GM crop. Any significant differences that are identified in this systematic comparison of the GM crop and the comparator then are subject to further investigation as to whether this difference might have implications for human health. Section 5 discusses implications of advances in molecular biology and the development of in vitro and in vivo test methods for the future refinement of food safety assessment strategies.

The paper provides detailed guidance for anyone involved in risk assessment and regulation of GM crops. The paper emphasises that this systematic approach to food safety assessment of GM crops offers a high level of safety assurance: this iterative and case-focused design of safety testing strategies ensures that all tested and approved foods derived from GM crops are as safe and nutritious as currently consumed plant-derived foods. The paper also considers how our continuously improving understanding of molecular biology, biochemistry, and nutrition will over time facilitate the development of new crop varieties and their safety assessment. The conclusion provides recommendations on priorities for research and development of test methods and strategies.
